5. Parámetros de transformación.....	7
APÉNDICE 1. LISTADO DE PUNTOS	9

1. Introducción y objeto

El objeto del presente anejo es describir los trabajos de cartografía y topografía realizados para la transformación y actualización de la cartografía disponible que es la del proyecto redactado en 2012: "Proyecto de ejecución de las obras de urbanización del Sector Grao de Valencia".

El documento se estructura por tanto del siguiente modo:

- Datos de partida y actualización.
- Toma de datos de campo.
- Cálculo de los parámetros de transformación entre sistemas de coordenadas.
- Transformación y actualización de la cartografía a ETRS-89.

2. Datos de partida y actualización

En el presente proyecto el principal dato de partida es el contenido del Anejo 3: Topografía y Cartografía del Proyecto de ejecución de las obras de urbanización del Sector Grao de Valencia, redactado en 2012.

Según se describe en el citado anejo, el alcance de los trabajos era completar la cartografía disponible en esa fecha y realizar una implantación de bases para futuros trabajos. Así mismo, se indica que las coordenadas estaban en el sistema UTM, si bien no se especifica el sistema de referencia utilizado (ED50, ETRS89, etc.).

También se especifica que: "...todo el trabajo realizado se ha referenciado posteriormente a las Bases Cartográficas Municipales, facilitadas por el Servicio de Cartografía del Ayuntamiento de Valencia".

Así pues, el objeto del presente trabajo ha consistido en primer lugar, en transformar la cartografía disponible en formato DWG, supuestamente referenciado a las Bases Cartográficas Municipales, en el sistema de coordenadas UTM-ETRS89, que es el sistema oficial actualmente.

Una vez transformada la cartografía digital, se ha procedido a densificar y actualizar en aquellas zonas donde se ha considerado necesario para la correcta definición de las obras.

En el citado anejo se incluyen tanto las reseñas de las Bases Cartográficas Municipales como las de las nuevas bases implantadas.

En resumen, se dispone de los siguientes datos de partida:

- Reseñas de la Red de Bases Cartográficas Municipales.
- Reseñas de las bases implantadas en la fase anterior.
- Cartografía en formato DWG.

Tras el análisis de esta información, se obtienen las siguientes conclusiones:

- Se aprecia una discordancia entre las coordenadas indicadas en las reseñas de las bases implantadas y las de la cartografía en DWG.

- En la cartografía en DWG no aparecen las bases de la Red Cartográfica Municipal, por lo que no es posible utilizarlas para la transformación de la cartografía.
- Así pues, es necesario realizar una transformación entre el sistema de coordenadas de la cartografía disponible y el oficial UTM-ETRS89.

3. Metodología adoptada

3.1. Introducción

Para realizar la transformación entre los diferentes sistemas de coordenadas hay que disponer de puntos comunes en ambos sistemas, para lo que hay que proceder a la localización en campo las bases topográficas utilizadas para la obtención de la cartografía, así como demás elementos característicos (alineaciones, trapas, bordillo, etc.) que permitan realizar la transformación.

Una vez localizados puntos comunes entre la cartografía y el terreno, se procederá a la obtención de las coordenadas UTM-ETRS89.

3.2. Sistema de referencia empleado

La georreferenciación de la cartografía se realiza en el sistema de referencia geodésico oficial ETRS89 (REAL DECRETO 1071/2007, de 27 de julio, por el que se regula el sistema geodésico de referencia oficial en España), en Proyección Universal Transversa Mercator (U.T.M.) definido por el Instituto Geográfico Nacional por los parámetros siguientes:

- Elipsoide Internacional (GRS80).
- Latitudes referidas al Ecuador y consideradas positivas al Norte y negativas al Sur de este.
- Longitudes referidas al Meridiano de Greenwich y consideradas positivas al Este y negativas al Oeste de este.
- El origen de altitudes es el del nivel medio del mar en el mareógrafo de Alicante, habiendo sido adquirido de las señales de Nivelación de Alta Precisión (N.A.P.), Nivelación de Precisión (N.P.) o Nivelación Geodésica (N.G.), establecidas por el Instituto Geográfico Nacional (I.G.N.).
- Respecto al enlace con altimetría, el modelo de geoide utilizado ha sido el EGM2008 REDNAP, ya que es el que ofrece una mejor aproximación. La diferencia respecto a las señales N.A.P. contrastadas en la zona es de -0.065m.

3.3. Metodología e instrumentación

La metodología para obtener las coordenadas de los puntos comunes fue realizar observaciones GNSS con un receptor GPS en tiempo real (RTK), enlazando el receptor por GPRS en solución de red VRS con la red ERVA de estaciones fija de referencia GNSS del Instituto Cartográfico Valenciano (ICV), tomando información de los distintos elementos a representar.

Las condiciones imprescindibles para realizar la observación consistieron en contar con un número mínimo de 10 satélites situados con una elevación sobre el horizonte superior a los 15° y un valor de GDOP inferior a 5.

Los tiempos de observación no ha sido en ningún caso inferior a los 10 minutos.

El instrumental utilizado ha sido un equipo GPS móvil EMLID RS2 con software TCP GPS-Pro.

4. Observación de bases de replanteo

A continuación, se muestran las coordenadas observadas en UTM ETRS-89 de las bases de las bases existentes localizadas en la zona de trabajo.

5. Parámetros de transformación

Tras analizar ambos sistemas de coordenadas (Cartografía dwg y ETRS89), se ha calculado los parámetros de transformación entre ambos sistemas para la zona de los trabajos que nos ocupa, para facilitar el intercambio de información entre ambos sistemas de coordenadas.

Para el cálculo se ha utilizado el programa informático TcpMDT, y se ha seguido la metodología de cálculo de transformación de semejanza de 7 parámetros (Helmert), dónde se calculan los parámetros de traslación en los tres ejes (Tx,Ty, Tz), rotación (Rx,Ry,Rz) y el factor de escala.

En las tablas siguientes se muestran los resultados obtenidos de ambos procesos.
